Conventional Brands

Shaklee Green Cleaners VS Conventional Brands

Have you ever noticed that the labels of cleaning products have no list of ingredients?

In the US and Canada, companies that make household cleaners aren't required by law to print a full list of ingredients on their packaging. That means you have no idea what you're exposing yourself and your family to when you mop your floors or clean the oven.

I think that's scary and downright dangerous.

I couldn't believe it when I read that kids missed 14,000,000 school days a year because of asthma. They now believe this is linked to poor indoor air quality caused in part from chemical cleaners.

And home cleaning products may be as harmful as 20 cigarettes a day!

A study by scientists at the University of Bergen in Norway finds that regular use of cleaning sprays can have the same health impact as smoking a pack of cigarettes a day.

The big loophole exists because there aren't any testing requirements for most of the chemicals in cleaning products.

I like that in Europe, they reverse the burden of proof. Manufacturers have to show that chemicals are safe before they introduce them. In the U.S. and Canada, chemicals are innocent until proven guilty.

So it begs the question...

Why do so many brands use toxic ingredients?

The answer is simple. It's cheaper and more profitable for them.

Hidden ingredients in your cleaning products can hurt your family and our environment. It floors me that some laundry detergents can induce asthma and they're still allowed to sell it. Or that cleaning your bathtub may be exposing you to cancer-causing substances and even your dish soap may be doing damage to the fish and aquatic life near your home.

Here are just 3 of the killer chemicals you may not find on the label.

1. Hydrochloric Acid

Found in: Odor eliminators and toilet bowl cleaners

Side effects: Can cause severe damage to the skin. It can be harmful to health if inhaled and can also be fatal if swallowed.

2. Butyl Cellosolve

Found in: Cleaning wipes, degreasers, floor polish, rug shampoos, toilet bowl cleaners, tub and tile cleaners, and window cleaners

Side effects: Can cause irritation and tissue damage from inhalation.

I know sometimes it's easier to just buy what's in the store, but if you're still buying chemical cleaners who knows what it's doing to you.

Did you know that many doctors and cancer treatment centers tell patients to rid their homes of conventional cleaning products once they've been diagnosed with the big "c"?

So I have to ask, why not get rid of them earlier? Why wait for illness before reducing your exposure to known or potential cancer-causing chemicals.

Green cleaners in my experience work better and they're cheaper.

- Green products have no ingredients that could be harmful to your health or the environment.
- They're readily biodegradable— in less than 28 days.
- They contain no phosphates or phthalates.
- They use plant-based, not petroleum-based ingredients.

But are they as effective? If you're used to using regular store-bought cleaners, you may think they work better and are less expensive than green cleaners.

Now you probably don't have the time or energy to make your own from baking soda and other natural ingredients, so if you're considering a break-up, I'd like to suggest trying Shaklee's Get Clean Starter Kit.

After using Shaklee's green cleaners, I have discovered that they work better than harsh chemicals and they're cheaper in the long run because they are concentrated. It even comes with a cool caddy to keep it all together.
